Implementation 2: Application with chat widget embedded (using langflow cdn)

Testcase Generator Chat

Generate structured test cases from requirements using a Langflow chat interface. Choose sample stories, refine details, then export test cases in a ready-to-use Excel-compatible format.

Switch to Dark Mode

Sample User Stories

Use these starter stories for Banking, Finance, and Insurance domains as guidance while entering your query directly into the chat widget.

Banking:

As a customer, I want to transfer funds between my accounts so I can move money securely and quickly.

Finance:

As a user, I want to generate an investment summary report so I can review portfolio performance each month.

Insurance:

As a policyholder, I want to file a claim online so I can receive approval and payment faster.

Suggested prompt to enter in the chat widget:

Generate 5 test cases for UPI transaction with columns: TestcaseTitle, Description, TestSteps, ExpectedResults.

The embedded Langflow chat will appear below. Enter the prompt exactly as shown to generate structured test cases.

Implementation 3: without using cdn

With google font and bootstrap cdns:

Without bootstrap cdns:

As a customer, I want to transfer funds between my accounts so I can move money securely and quickly.

Finance:

As a user, I want to generate an investment summary report so I can review portfolio performance each month.

Insurance:

As a policyholder, I want to file a claim online so I can receive approval and payment faster.

Suggested prompt to enter in the chat widget:

Generate 5 test cases for UPI transaction with columns: TestcaseTitle, Description, TestSteps, ExpectedResults.

Use this exact prompt in the chat widget:

Generate 5 test cases for UPI transaction in a table format with columns: TestcaseTitle, Description, TestSteps, ExpectedResults.

If the response says out of scope, re-enter the prompt starting with "Generate 5 test cases" and make sure you are using the chat input field inside the widget.

SCRUM-575: Doctor Prescription Verification Workflow

Summary:As a doctor, I want an automated prescription verification system so that I can review, approve, or modify prescriptions digitally before they are sent to the pharmacy. Description:The system should enable doctors to view medication details prescribed by other physicians or generated automatically from patient diagnosis. It should allow verification of dosage, potential interactions, and duplicate drugs. Once verified, prescriptions should automatically sync with the pharmacy module for patient dispensing. Acceptance Criteria: Given a doctor with access to a patient record,When they open the prescription module,Then all pending prescriptions should be displayed for verification. Given a prescription with errors (dosage conflict or duplicate medicine),When the doctor reviews it,Then the system should highlight issues and provide AI-based recommendations for correction. Given a verified prescription,When it is approved,Then it should automatically update the pharmacy dispensing queue.

CARE-190: Masters Others Derive Service

As a user, I want to masters others derive service so that the related functionality works as expected.

Input User Story:
As a pharmacist, I want to receive automated notifications when a patient's prescription is overdue for pickup, to ensure timely medication adherence and reduce waste.
Parameter Scores (out of 20)
Parameter	Description	Score (out of 20)
Clarity	The story is clear but lacks detailed acceptance criteria for notification timing and frequency.	16
Completeness	Preconditions for notification triggers (e.g., prescription expiration, patient non-response) are not clearly mentioned.	12
Business Value Alignment	Strong healthcare relevance and adherence focus, but could be more specific about patient outcomes.	18
Testability	Can be tested through prescription workflow automation and notification system integration.	19
Technical Feasibility	Technically feasible with EHR integration and existing notification systems.	17
Overall Score: 82 / 100
Improvement Areas:
1. **Add explicit acceptance criteria for notification timing and frequency:**
* Specify the exact time frame for notification triggers (e.g., 3 days before prescription expiration).
* Define the notification frequency (e.g., daily, weekly).
2. **Specify validation rules for notification triggers:**
* Identify the specific conditions that trigger notifications (e.g., prescription expiration, patient non-response).
* Define the validation rules for these conditions (e.g., check for prescription status, patient contact information).
3. **Include system actor details for notification workflow:**
* Specify the roles and responsibilities of system actors involved in the notification process (e.g., pharmacist, patient, system administrator).
* Define the communication channels and protocols for
